

# Taazaa Training

## Assignment -11

**“Database creation ,Table Creation, Primary Key , Super key, Foreign Key, Candidate Key, Alternate Key, Composite Key, Inserting Value in Table”**

**Submitted By :-**

**Gurpreet Singh**

# Database Creation

Command :-

create database <database name>;

```
SQL Shell (psql)
Port [5432]:
Username [postgres]:
Password for user postgres:
psql (13.4)
WARNING: Console code page (437) differs from Windows code page (1252)
         8-bit characters might not work correctly. See psql reference
         page "Notes for Windows users" for details.
Type "help" for help.

postgres=# create database mickey
postgres=# ;
CREATE DATABASE
postgres=# \l
```

List of databases						
Name	Owner	Encoding	Collate	Ctype	Access privileges	
dbname	postgres	UTF8	English_United States.1252	English_United States.1252		
gurpreet	postgres	UTF8	English_United States.1252	English_United States.1252		
mickey	postgres	UTF8	English_United States.1252	English_United States.1252		
postgres	postgres	UTF8	English_United States.1252	English_United States.1252		
template0	postgres	UTF8	English_United States.1252	English_United States.1252	=c/postgres	+
					postgres=CTc/postgres	
template1	postgres	UTF8	English_United States.1252	English_United States.1252	=c/postgres	+
					postgres=CTc/postgres	

```
(6 rows)
```

# See All Databases & Connecting with Database

To see database in postgresql

- Command :- \l

To connect with database

- Command :- \c <database name>

```
SQL Shell (psql)
Server [localhost]:
Database [postgres]:
Port [5432]:
Username [postgres]:
Password for user postgres:
psql (13.4)
WARNING: Console code page (437) differs from Windows code page (1252)
8-bit characters might not work correctly. See psql reference
page "Notes for Windows users" for details.
Type "help" for help.

postgres=# \l

          List of databases

```

Name	Owner	Encoding	Collate	Ctype	Access privileges
dbname	postgres	UTF8	English_United States.1252	English_United States.1252	
gurpreet	postgres	UTF8	English_United States.1252	English_United States.1252	
mickey	postgres	UTF8	English_United States.1252	English_United States.1252	
postgres	postgres	UTF8	English_United States.1252	English_United States.1252	
template0	postgres	UTF8	English_United States.1252	English_United States.1252	=c/postgres +
template1	postgres	UTF8	English_United States.1252	English_United States.1252	postgres=Ctc/postgres +

```

(6 rows)

postgres=# \c mickey
You are now connected to database "mickey" as user "postgres".
mickey=#
```

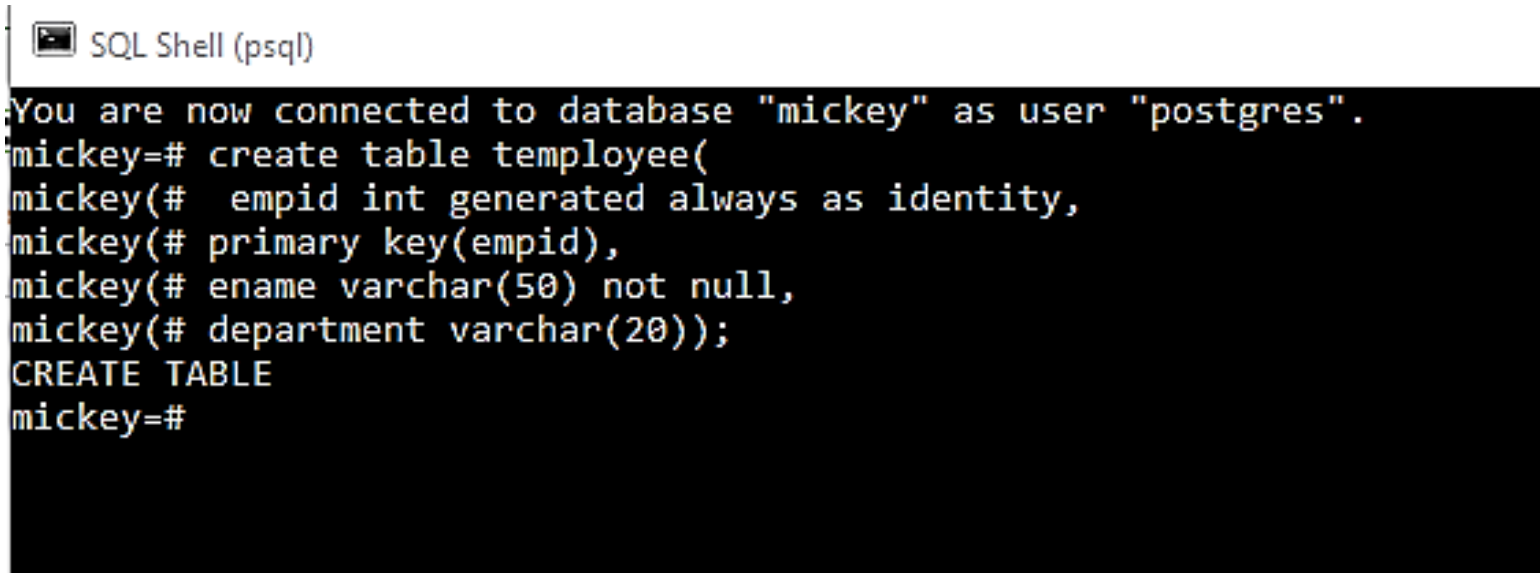

# Table Creation in Postgresql

## Command:-

```
create table <table name>(  
column1 datatype(length) column_constraint,  
column2 datatype(length) column_constraint,  
column3 datatype(length) column_constraint);
```

## For eg:-

```
mickey=# create table templovee(  
mickey(# empid int generated always as identity,  
mickey(# primary key(empid),  
mickey(# ename varchar(50) not null,  
mickey(# department varchar(20));
```

A screenshot of a terminal window titled "SQL Shell (psql)". The terminal shows a connection message: "You are now connected to database 'mickey' as user 'postgres'." followed by the execution of a CREATE TABLE command. The command is: "mickey=# create table templovee(mickey(# empid int generated always as identity, mickey(# primary key(empid), mickey(# ename varchar(50) not null, mickey(# department varchar(20));". The output shows "CREATE TABLE" and the prompt "mickey=#" again.

```
SQL Shell (psql)  
You are now connected to database "mickey" as user "postgres".  
mickey=# create table templovee(  
mickey(# empid int generated always as identity,  
mickey(# primary key(empid),  
mickey(# ename varchar(50) not null,  
mickey(# department varchar(20));  
CREATE TABLE  
mickey=#
```

# Primary Key

- It is the key which is used to identify one and only one instance of an entity uniquely. An entity can contain multiple keys as we saw in PERSON table. The key which is most suitable from those lists become a primary key.
- In the EMPLOYEE table, ID can be primary key since it is unique for each employee. In the EMPLOYEE table, we can even select License\_Number and Passport\_Number as primary key since they are also unique.
- For each entity, selection of the primary key is based on requirement and developers.

# Rules & Creation of Primary Key

## Rules:-

- The primary key column cannot contain a null or empty value.
- The primary key column value must be unique.
- Each table can have only one primary key.
- If we are using the primary key, we should use **INT** or **BIGINT** data type as it is recommended.

we can create a primary key with the help of the following commands:

- **CREATE TABLE command**

During table creation

- **ALTER TABLE command**

After table creation

# Creation of Primary Key using **CREATE TABLE** command

## Syntax:-

```
CREATE TABLE table_name  
(  
    column1 datatype CONSTRAINT constraint_name PRIMARY KEY,  
    column2 datatype [ NULL | NOT NULL ],  
    ...  
);
```

## Or

```
CREATE TABLE table_name  
(  
    column1 datatype [ NULL | NOT NULL ],  
    column2 datatype [ NULL | NOT NULL ],  
    ...  
    CONSTRAINT constraint_name  
    PRIMARY KEY (column_name(s))  
);
```

## For eg:-

```
mickey=# create table tempolyee(  
mickey(# empid int generated always as identity,  
mickey(# primary key(empid),  
mickey(# ename varchar(50) not null,  
mickey(# department varchar(20));
```

 SQL Shell (psql)

```
You are now connected to database "mickey" as user "postgres".  
mickey=# create table tempolyee(  
mickey(# empid int generated always as identity,  
mickey(# primary key(empid),  
mickey(# ename varchar(50) not null,  
mickey(# department varchar(20));  
CREATE TABLE  
mickey=#
```

# Foreign Key

- A **foreign key** is a group of columns with values dependent on the [primary key](#) benefits from another table. It is used to have the value in one column or group of columns displayed in the same column or combination of columns in another table.
- The **foreign key** is also known as the **referencing key**, and it matches the primary key field from another table, which implies that the foreign key field in one table refers to the other table's primary key field.

## create a Foreign key in PostgreSQL

- In PostgreSQL, we can create a foreign key with the help of the following commands:
- **CREATE TABLE command**
- **ALTER TABLE command**

# Creation of Foreign Key using **CREATE TABLE** command

Syntax:-

[**CONSTRAINT** constraint\_name]  
**FOREIGN KEY** [foreign\_key\_name] (column\_name, ...)

**REFERENCES** parent\_table\_name (column\_name,...)

For eg:-

```
mickey=# create table ttools(  
mickey(# tool_id int generated always as identity,  
mickey(# tool_name varchar(200) not null,  
mickey(# tempid int,  
mickey(# pcode int not null,  
mickey(# constraint fkid foreign key(tempid)  
references tempemployee(empid));  
CREATE TABLE
```

SQL Shell (psql)

```
LINE 2: tool-id int generated always as identity,  
      ^  
mickey=# create table ttools(  
mickey(# tool_id int generated always as identity,  
mickey(# tool_name varchar(200) not null,  
mickey(# tempid int,  
mickey(# pcode int not null,  
mickey(# constraint fkid foreign key(tempid) references tempemployee(empid));  
CREATE TABLE  
mickey=#
```

# Inserting Values in Tables

**Syntax:-** INSERT INTO table\_name(column1, column2, ...) VALUES (value1, value2, ...);

## In employee table

```
SQL Shell (psql)
mickey=#
mickey=# insert into employee(ename,department) values('Gurpreet Singh','Taazaa Trainee');
INSERT 0 1
mickey=# insert into employee(ename,department) values('Karan ','Taazaa Trainee');
INSERT 0 1
mickey=# insert into employee(ename,department) values('Rahul ','Taazaa Trainee');
INSERT 0 1
mickey=# insert into employee(ename,department) values('Das Sukhdev ','Taazaa Trainee');
INSERT 0 1
mickey=#
```

## In ttools table

```
SQL Shell (psql)
mickey=# insert into ttools(tool_name,tempid,pcode) values('Laptop ','1',101);
INSERT 0 1
mickey=# insert into ttools(tool_name,tempid,pcode) values('headphone ','1',102);
INSERT 0 1
mickey=# insert into ttools(tool_name,tempid,pcode) values('Laptop ','2',103);
INSERT 0 1
mickey=# insert into ttools(tool_name,tempid,pcode) values('Laptop ','3',104);
INSERT 0 1
mickey=#
```

# To Display Values from Tables

## Syntax:-

To display all values :- Select \* from <table name>

To display selected values:- select <Columns name> from <table name>

```
SQL Shell (psql)
mickey=# select * from tempolyee;
 empid |      ename      | department
-----+-----+-----
      1 | Gurpreet Singh | Taazaa Trainee
      2 | Karan           | Taazaa Trainee
      3 | Rahul           | Taazaa Trainee
      4 | Das Sukhdev     | Taazaa Trainee
(4 rows)

mickey=#
```

```
SQL Shell (psql)
mickey=# select * from ttools;
 tool_id | tool_name | tempid | pcode
-----+-----+-----+-----
      1 | Laptop    |      1 |   101
      2 | headphone |      1 |   102
      3 | Laptop    |      2 |   103
      4 | Laptop    |      3 |   104
(4 rows)
```

# **Candidate Key & Alternate Key**

- All those key in a table that can be served as a primary key are known as candidate key
- Eg:- in ttools table pcode ,tool\_id are the set of candidate key
- All those keys in candidate key that are not taken as primary key in table are known as alternate keys
- Eg:- in ttools table pcode is an alternate key

# Super Key & Composite key

- A super key is a group of single or multiple keys which identifies rows in a table.
- A Super key may have additional attributes that are not needed for unique identification.
- Eg:- in ttools table tool\_id,tempid,pcode...
- **COMPOSITE KEY** is a combination of two or more columns that uniquely identify rows in a table.
- The combination of columns guarantees uniqueness, though individually uniqueness is not guaranteed. Hence, they are combined to uniquely identify records in a table.
- Eg:- combination of pcode,temp\_id...
